

## Attachment 1 (Figures/Maps)

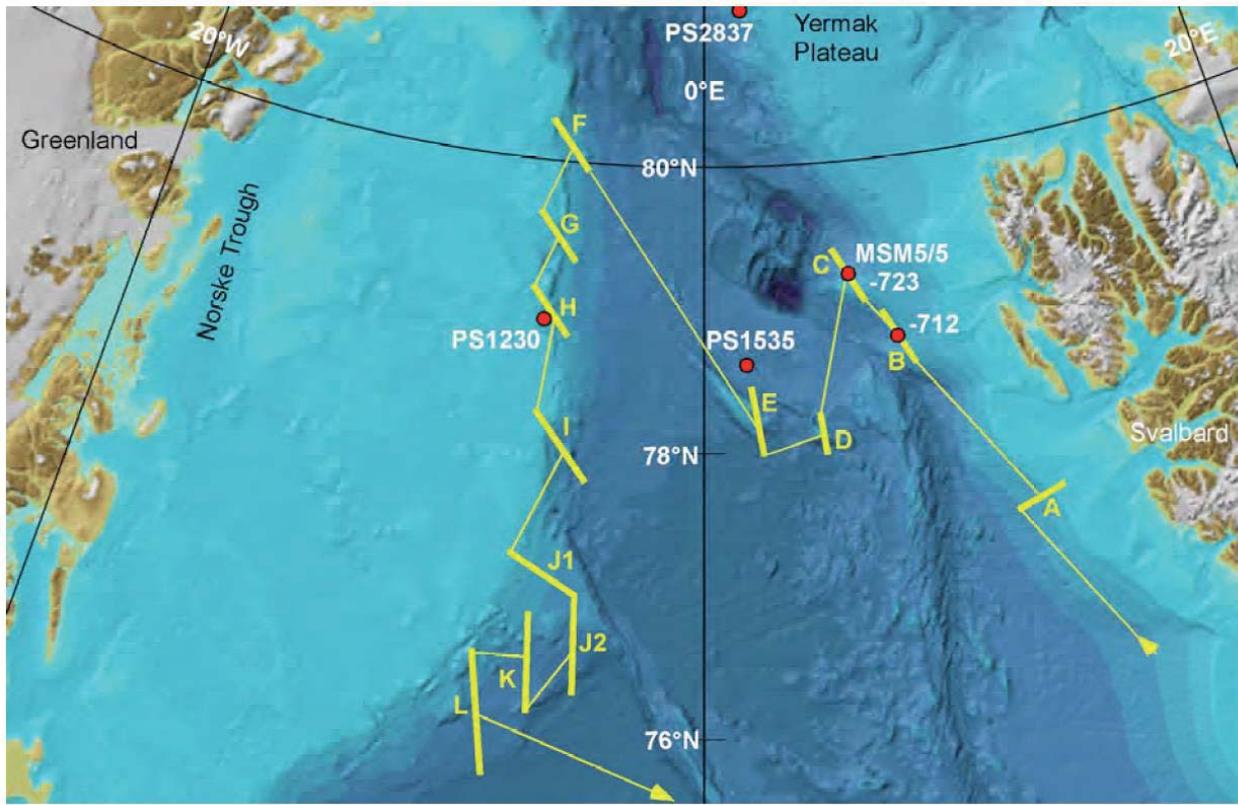

Fig. 1 (Map 1)

Main working area between northern Greenland and Svalbard (Fram Strait). In this area, detailed Parasound and Hydrosweep profiling surveys will be carried out in order to find areas suitable for sediment coring (12 proposed transects A to L). Coring will be carried out on selected transects (3-5 stations per transect), depending on Parasound/Hydrosweep results. Red circles indicate locations where sediment cores were taken during earlier expeditions.
